Encryption-selectable Optical Storage in LiNbO₃

Su, Wei-Chia; Sun, Ching-Cherng; Wang, Bor; Arthur E. T. Chiou

Abstract

We demonstrate an encryption-selectable holographic multiplexing storage in LiNbO₃. The storage of multiple holograms is based on angular multiplexing and random phase encoding. Phase conjugates of the reference beams are used to read out those stored patterns. The sensitivity of the displacement of the ground glass is analyzed theoretically.
